Battery energy storage 10 000 kilowatt price

Overview

Battery storage prices have gone down a lot since 2010. In 2025, they are about \$200–\$400 per kWh. This is because of new lithium battery chemistries. Different places have different energy storage costs. China’s average is \$101 per kWh. The US average is \$236 per kWh.

Figure ES-2 shows the overall capital cost for a 4-hour battery system based on those projections, with storage costs of \$147/kWh, \$243/kWh, and \$339/kWh in 2035 and \$108/kWh, \$178/kWh, and \$307/kWh in 2050 (values in 2024\$). How much does it cost to store 10,000 kilowatts of energy?

To store 10,000 kilowatts of energy, costs can significantly vary based on several determinants: 1. Technology type used, 2. Geographic location, 3. Storage duration, 4. Scale of deployment. Energy storage technologies, such as lithium-ion.

Buyers typically pay a broad range for utility-scale battery storage, driven by system size, chemistry, and project complexity. The price per kWh installed reflects balance of hardware, permitting, and integration costs. Cost also hinges on duration, interconnection requirements, and regional labor.

In 2025, the typical cost of a commercial lithium battery energy storage system, which includes the battery, battery management system (BMS), inverter (PCS), and installation, is in the following range: \$280 - \$580 per kWh (installed cost), though of course this will vary from region to region.

DOE's Energy Storage Grand Challenge supports detailed cost and performance analysis for a variety of energy storage technologies to accelerate their development and deployment. The U.S. Department of Energy's (DOE) Energy Storage Grand Challenge is a comprehensive program that seeks to accelerate.
