

## SolarTech Power Solutions

# Discharge depth of energy storage power station

## Overview

---

Discharge Depth (DoD) refers to the percentage of a battery's capacity that's actually used before recharging. Here's why your energy storage system cares: Take California's Moss Landing Energy Storage Facility – their secret sauce?

A 85% DoD limit using Tesla.

Discharge Depth (DoD) refers to the percentage of a battery's capacity that's actually used before recharging. Here's why your energy storage system cares: Take California's Moss Landing Energy Storage Facility – their secret sauce?

A 85% DoD limit using Tesla.

Energy storage power stations discharge energy to balance supply and demand, support grid stability, provide ancillary services, and offer backup power solutions. The discharge process occurs through various technologies, including batteries, pumped hydro storage, and other forms of energy storage.

As lithium-ion energy storage systems become increasingly essential in residential solar setups, commercial and industrial energy storage, and electric vehicles, one factor plays a pivotal role in system efficiency and battery longevity: Depth of Discharge (DOD). This article explains what DOD.

Does deep discharge depth reduce battery aging costs?

Deep discharge depth increases BESS energy consumption, which can ensure immediate revenue, but accelerates battery aging and increases battery aging costs. The proposed BESS management system considers time-of-use tariffs, supply deviations.

Depth of Discharge (DOD) refers to the percentage of a battery's total capacity that has been utilized. For example, if a 10 kWh battery discharges 3 kWh, its DOD is 30%. This value is the opposite of State of Charge (SOC),

which indicates the remaining energy. A deeper DOD means more energy has.

The calculation is based on 90% discharge depth, system efficiency attenuation of 5% in the first year and 2% per year after that, charge and discharge efficiency of 92%, and consumption days of 330 days. Under this model, the return rate of a relatively good distributed energy storage power.

The Depth of Discharge (DOD) is a critical parameter in energy storage systems, particularly those utilizing battery technologies. It refers to the percentage of the battery's capacity that is discharged relative to its total capacity. Understanding DOD is essential for optimizing the performance.
