Dual carbon energy storage system design

Overview

Dual-ion batteries that store energy through anion/cation intercalation are characterized by their wide working window, high safety and low costs. However, the unsatisfied capacity of dual-ion batteries seri.

Are dual-ion batteries suitable for energy storage?

However, the unsatisfied capacity of dual-ion batteries seriously inhibits their practical applications. Herein, a novel dual-carbon battery based on lithium-ion electrolyte, utilizing reduced oxide graphene (rGO) as the cathode material and mesocarbon microbead (MCMB) as the anode material is designed for efficient energy storage.

Are DCBS a good energy storage solution?

In brief, it introduces the reader to DCBs as one of the most promising energy storage solutions for balancing sustainability, cost and performance, their history, electrochemistry and associated charge storage mechanisms. Then, the past lessons with respect to their ion intercalation are provided.

Why does a dual carbon battery have a low coulombic efficiency?

During the initial cycles, the dual-carbon battery has a higher irreversible capacity due to the formation of the solid electrolyte interface (SEI) layer, leading to low coulombic efficiency. This is a common phenomenon in carbon material electrodes .

How reversible is a dual-carbon battery?

The dual-carbon battery structure has highly reversible/stable cycling ability. The Li-based DIB possesses a discharge capacity of 280 mA h g^{-1} at 1 A g^{-1} . The Na-based DIB possesses a discharge capacity of 190 mA h g^{-1} at 1 A g^{-1} . The dual-carbon battery can be extended to other ion energy storage applications.

What is a dual-carbon battery (DCB)?

Dual-carbon batteries (DCBs) with both electrodes composed of carbon

materials are currently at the forefront of industrial consideration. This is due to their low cost, safety, sustainability, fast charging, and simpler electrochemistry than lithium and other post-lithium metal-ion batteries.

What are the four configurations of dual-carbon electrochemical cells?

Figure 8 provides the four possible configurations of dual-carbon electrochemical cells according to their respective ion storage mechanisms. Here, the anode/cathode in cells can be arranged in an intercalation/intercalation, intercalation/adsorption, adsorption/intercalation, and adsorption/adsorption geometry.
