Early communication base station batteries

Overview

In this article, I explore the application of LiFePO₄ batteries in off-grid solar systems for communication base stations, comparing their characteristics with lead-acid batteries, analyzing discharge behaviors through a demonstration system, and proposing optimized control strategies to enhance system performance and reliability. Can repurposed EV batteries be used in communication base stations?

Among the potential applications of repurposed EV LIBs, the use of these batteries in communication base stations (CBSs) is one of the most promising candidates owing to the large-scale onsite energy storage demand (Heymans et al., 2014; Sathre et al., 2015).

What is battery management system (BMS)?

The battery management system (BMS) provides monitoring and manages the charge/discharge processes of the batteries. Fig. 2. (a) Schematic diagram of the CBS power supply system, (b) composition of DC power supply system of CBS.

Are lithium-ion batteries used in EV power supply systems?

Owing to the long cycle life and high energy and power density, lithium-ion batteries (LIBs) are the most widely used technology in the power supply system of EVs (Opitz et al. (2017); Alfaro-Algaba and Ramirez et al., 2020).

What is the recycling stage of a lithium ion battery?

In the recycling stage, the collected LIB packs are dismantled to obtain the main components, such as battery cells, BMSs, and packaging, and various material fractions are recovered from these components separately (Table A1 in the supplementary materials).
