

Overview

Integrated energy system is efficient and flexible in distributed energy supply, but the coupling of energy flows and the inaccuracy of prediction bring challenges to its economic operation. Peak shaving and dema.

What is a unified Spatial-Temporal cooperative framework for Integrated Energy Systems?

To this end, a unified spatial-temporal cooperative framework for the integrated energy system, which considers the coordination between intra-regional multi-energy coupling and cross-regional multi-agent-system energy sharing, is proposed in this paper.

What are the main contributions of IES unified Spatial-Temporal cooperative dispatching framework?

The main contributions are summarized as follows. A novel unified spatial-temporal cooperative dispatching framework for the cross-regional IES is proposed, coordinating the intra-regional multi-energy networks and cross-regional multi-agent systems in a more flexible manner to overcome information barriers and handle RES uncertainties.

What is battery energy storage system (BESS)?

Abstract: Battery energy storage system (BESS) plays an important role in solving problems in which the intermittency has to be considered while operating distribution network (DN) penetrated with renewable energy.

What are the operating constraints of multi-energy storage units (EES & NGS)?

Besides, multi-energy storage units (EES, NGS) realize transferring energy over time, which have the similar operating constraints include energy storage capacity state constraints (23) (28), capacity limit constraints (24) (29), input and output power or flow constraints (25) (26) (30) (31), and operating state constraints (27) (32).

What is a unified Spatial-Temporal dispatching framework?

In this paper, a unified spatial-temporal dispatching framework is established to achieve coordination between intra-regional multi-energy coupling and cross-regional multi-agent-system energy sharing. The main conclusions are summarized as follows.

How does the dispatching step and Horizon affect the operation scheme?

In the temporal dimension, the dispatching step and horizon directly impact the economy and reliability of the operation scheme, due to the forecast errors of RES and the response speed of units .
