Libya announces new onshore oil discovery that could significantly alter the country's hydrocarbon production capacity and strengthen its position in global energy markets. This development represents more than a routine exploration success, as it demonstrates Libya's continued geological potential.

Many of us want an overview of how much energy our country consumes, where it comes from, and if we're making progress on decarbonizing our energy mix. This page provides the data for your chosen country across all of the key metrics on this topic. In the selection box above you can also add or.

In 2023, Libya was the number 97 (out of 195) economy in the world in terms of GDP (\$45.1B current US\$), the number 67 (out of 226) in total exports, the number 112 (out of 196) economy in terms of GDP per capita (current US\$). In 2023, Libya was the number 111 (out of 132) most complex economy.

Total energy supply (TES) includes all the energy produced in or imported to a country, minus that which is exported or stored. It represents all the energy required to supply end users in the country. Some of these energy sources are used directly while most are transformed into fuels or.

The national grid operates at 62% capacity utilization during peak hours, yet demand's projected to surge 81% by 2030 [3]. So what's really causing this power crunch?

The answer lies in three critical gaps: Wait, no – let's correct that. Libya actually receives 3,500+ annual sunshine hours [6].

capacity (kWh/kWp/yr). The bar chart shows the proportion of a country's land area in each of these classes and the global distribution of land area across the class at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global.
