

**SolarTech Power Solutions**

# **Lifespan of Home Energy Storage Power Supply**

## Overview

---

A typical residential energy storage system has a lifespan of 1. 5 to 15 years, 2. influenced significantly by usage patterns, 3. varying depending on technology type, and 4. affected by environmental conditions. How long do solar batteries last?

Home battery backups usually last 5 to 15 years. High-quality lithium-ion batteries may last even longer. A 10 kWh battery can power critical systems for about 24 hours during a blackout. With proper management, they can last longer. You should plan to replace batteries once or twice over your solar system's lifespan.

How many battery energy storage systems are there in Australia?

Data collected by analyst SunWiz found that a record 57,000 residential battery energy storage systems, with a combined capacity of 656 MWh, were installed in Australian homes in 2023, up 21% on the previous year. About 250,000 Australian homes, totalling 2,770 MWh, now have a battery system.

How long do home batteries last?

The expected life for home batteries is usually between 6,000 to 8,000 cycles. Similarly, you might see an expected energy "throughput" listed somewhere on your warranty. This is another way the manufacturer estimates your battery's lifespan.

How long does a home battery backup last?

Home battery backups typically last between 5 to 15 years, depending on usage and technology. Most lithium-ion models, commonly used in residential systems, can last around 10 to 15 years with regular cycling. Lead-acid batteries, another popular option, generally last 3 to 7 years.

How long will a 10 kWh battery last during a blackout?

A 10 kWh battery can power critical systems for about 24 hours during a

blackout. With proper management, they can last longer. You should plan to replace batteries once or twice over your solar system's lifespan. The power duration during outages depends on usage and battery size.

How long does a power outage last?

If local outages typically last 2 hours, smaller backups suffice. However, for extended outages, a larger backup or multiple batteries are necessary. An emergency plan should factor in both the average outage length and the worst-case scenarios. According to the U.S. Energy Information Administration, the average outage lasts around 2.5 hours.
