

## SolarTech Power Solutions

**Lithium battery pack is protected once it is charged**

## Overview

---

Leaving a lithium-ion battery on the charger is generally safe due to built-in protections against overcharging; however, it's best practice not to leave it connected for extended periods after reaching full charge for optimal longevity. Is it safe to leave a lithium-ion battery on the Charger?

In summary, while leaving a lithium-ion battery on the charger is generally safe due to advanced battery management systems, it is not without its risks. For optimal battery health and longevity, we recommend unplugging devices once they are fully charged or maintaining a charge level between 20% and 80%.

Why is it important to charge lithium-ion batteries correctly?

Charging lithium-ion batteries correctly is essential for maximizing lifespan and maintaining battery performance in demanding applications. You rely on precise control during the charging process to avoid overcharging, which can cause irreversible damage and shorten battery longevity.

Do lithium-ion batteries need a deep charge?

When it comes to maintaining the health and longevity of lithium-ion batteries, paying attention to the depth of charge is crucial. Charging and storing batteries at high charge levels, especially above 80%, can result in accelerated capacity loss over time.

Can a lithium ion battery be left plugged in?

Good charging practices help the battery maintain optimal performance. Many believe that leaving a device plugged in will overcharge the battery and cause damage. However, lithium-ion batteries are designed with built-in mechanisms to prevent overcharging.

Do lithium-ion batteries have memory?

Unlike some older battery technologies, lithium-ion batteries do not suffer

from the memory effect. This means you don't need to fully discharge your battery before recharging it. Feel free to charge your lithium-ion battery whenever it's convenient without worrying about diminishing its capacity.

Do lithium ion batteries need a full charge?

Lithium-ion batteries thrive on regular partial charges rather than complete ones. Avoiding full discharges minimizes battery wear. Keeping your device in the mid-range charge levels reduces the number of full cycle counts, which in turn extends the life of the battery.
