

SolarTech Power Solutions

Low inverter production power

Overview

What if a microinverter has not produced power for 5 days?

Error: More than one microinverter has not produced power for five days. Homeowners and installers will receive alerts via text, email, or push based on selected notification preferences when either: More than one microinverter has not produced power for five days. System production drops below the installer-set threshold.

Why is my microinverter not working?

If your system shows a low production warning and most microinverters are off, check with your installer. They may have powered down the system intentionally (e.g., awaiting PTO). If a reporting issue persists beyond the initial timeframe, track the system's status.

What happens if a solar inverter overloads?

An overload in a solar inverter occurs when the power input from the solar panels exceeds the inverter's capacity to handle or convert it safely into output power. This condition can stress the inverter's components, such as capacitors and cooling systems, beyond their operational limits.

What happens if an inverter fails?

Component Wear: Deterioration of critical components can disrupt waveform regulation. This failure can result in the inverter producing electricity that is out of specification, potentially damaging connected devices or leading to disconnection from the grid.

Can you use an inverter if it's raining?

Never install any hardware while the AC power is connected to the inverter. Failure to disconnect AC power can result in injury or death. Never open the inverter if it is raining or expose the inverter to moisture. Always follow OSHA guidelines and your company's workplace safety protocols when working

inside the inverter.

What happens if a microinverter stops communicating?

When a microinverter stops communicating, the system status in the Enphase Installer Portal or the Enphase App will display a Microinverter Not Reporting alert. The system categorizes the issue as follows. Warning: At least one microinverter has not reported for 12 hours during daylight.
