Malta Energy 5G base station

Overview

What is 5G NR?

The 5G NR standard has been designed based on the knowledge of the typical traffic activity in radio networks as well as the need to support sleep states in radio network equipment. By putting the base station into a sleep state when there is no traffic to serve i.e. switching off hardware components, it will consume less energy.

How does 5G work?

5G requires more antennas. The 5G base station is a wireless receiver and short-range transceiver that connects wireless devices to a central hub. Its antenna and analog-to-digital converters (ADCs) convert the radio frequencies (RF) signals into digital, and then back again. Base stations rely on advanced antenna technology.

What are the components of a 5G base station?

Baseband Unit (BBU): Handles baseband signal processing. Remote Radio Unit (RRU): Converts signals to radio frequencies for transmission. Active Antenna Unit (AAU): Integrates RRU and antenna for 5G-era efficiency. 2. Power Supply System This acts as the “blood supply” of the base station, ensuring uninterrupted power. It includes:.

How to evaluate a 5G energy-optimised network?

To properly examine an energy-optimised network, it is very crucial to select the most suitable EE metric for 5G networks. EE is the ratio of transmitted bits for every joule of energy expended. Therefore, while measuring it, different perspectives need to be considered such as from the network or user’s point of view.

What are the challenges of 5G base station design?

For 5G to deploy on a large scale, thermal management is therefore a top

priority for 5G base station designs. These 5G issues must be addressed at the design stage with active thermal management solutions. The challenges with 5G not only encompass base stations, but also device form factors, such as smart phones.

Why is thermal management important for 5G base station designs?

With high temperatures come electromigration. The radiation of embedded antennas weakens at the frequencies required. For 5G to deploy on a large scale, thermal management is therefore a top priority for 5G base station designs. These 5G issues must be addressed at the design stage with active thermal management solutions.
