New magnesium battery energy storage

Overview

Magnesium is much more abundant and less costly than lithium, which would help further sustainable energy storage. Now, the Waterloo team is one step closer to bringing magnesium batteries to reality, which could be more cost-friendly and sustainable than the.

University of Waterloo researchers have made a key breakthrough in developing next-generation batteries that are made using magnesium instead of lithium. When the idea to create batteries using magnesium was first shared in a seminal academic paper in 2000, that novel design didn't provide enough.

A new magnesium battery can charge, work at room temperature, and use common materials. Could this be the breakthrough that challenges lithium for energy storage?
