Nigeria 5G communication base station energy storage system and supporting facilities

Overview

Why do we need a 5G base station?

The limited penetration capability of millimeter waves necessitates the deployment of significantly more 5G base stations (the next generation Node B, gNB) than their 4G counterparts to ensure network coverage . Notably, the power consumption of a gNB is very high, up to 3–4 times of the power consumption of a 4G base stations (BSs).

Are 5G network operators motivated to cooperate with the power system?

On the one hand, 5G network operators are highly motivated to cooperate with the power system in energy matters, given that the numerous gNBs with their high energy consumption result in significant electricity bills that can be troublesome for the operators , .

How a 5G network can support a power system?

The 5G network and power system are coupled energetically by power feeders. Based on gNB-sleep actions and mode switching of their BESSs, 5G network can provide power support to the power system when the grid frequency deviation reaches the threshold.

What is a 5G network?

The 5G network plane consists of three layers: 5G-CN, 5G-TN, and 5G-RAN. The servers in 5G-CN operate as a centralized controller while 5G-TN is responsible for the bi-directional transmission of information. In 5G-RAN, the gNB systems within designated areas are combined into gNBs-clusters by aggregators.

Why do we need a 5th-generation mobile network?

The increasing penetration of renewable energy sources, characterized by variable and uncertain production patterns, has created an urgent need for enhanced flexibility in the frequency control of power systems. In parallel, the

deployment of 5th-generation mobile network (5G) infrastructures has rapidly expanded in recent years.

Can a 5G network provide energy incentives?

Collaborating with the power system can provide energy incentives for 5G networks. On the other hand, the existing communication infrastructure in 5G networks allows network operators to participate in demand response without the need for additional investments in flexibility modifications. 1.2.
