## Overview

---

Solar panels that face east or west will produce about 15% less energy than those installed on a south-facing roof. A north-facing roof is the worst direction for solar, as panels will produce around 30% less energy than if they face south.

Solar panels that face east or west will produce about 15% less energy than those installed on a south-facing roof. A north-facing roof is the worst direction for solar, as panels will produce around 30% less energy than if they face south.

East-West Orientations Offer Strategic Value: While producing 75-85% of south-facing output, east and west-facing panels can provide superior financial returns by aligning with time-of-use electricity rates and matching typical household consumption patterns. Latitude-Based Angle Calculation.

According to the Department of Energy, the best direction for solar panels to face in the United States is south, as the sun spends most of its time traveling across the southern part of the sky. Solar panels save you money on your electricity bills by producing electricity for your home to use.

Within the solar industry, it's common knowledge that the optimal orientation of solar photovoltaic (PV) panels in the Northern Hemisphere is typically south, to maximize electricity production over the life of the system. Recently, however, there has been much discussion, and even incentives being.

Solar panel orientation is simply which cardinal direction the panel is facing: north, south, east or west. Typical solar panel application will follow true direction rather than aligning with the magnetic poles. For example, true north aligns with earth's true axis rather than aligning with the.
