Price per kilowatt for grid energy storage batteries

Overview

National pricing snapshot for utility-scale storage projects generally ranges from \$200 to \$520 per kWh installed, with most utility-scale projects clustering around \$300-\$420 per kWh for typical 1-4 hour durations.

National pricing snapshot for utility-scale storage projects generally ranges from \$200 to \$520 per kWh installed, with most utility-scale projects clustering around \$300-\$420 per kWh for typical 1-4 hour durations.

Buyers typically pay a broad range for utility-scale battery storage, driven by system size, chemistry, and project complexity. The price per kWh installed reflects balance of hardware, permitting, and integration costs. Cost also hinges on duration, interconnection requirements, and regional labor.

In this work we describe the development of cost and performance projections for utility-scale lithium-ion battery systems, with a focus on 4-hour duration systems. The projections are developed from an analysis of recent publications that include utility-scale storage costs. The suite of

In 2025, the typical cost of a commercial lithium battery energy storage system, which includes the battery, battery management system (BMS), inverter (PCS), and installation, is in the following range: \$280 - \$580 per kWh (installed cost), though of course this will vary from region to region.

In 2025, you're looking at an average cost of about \$152 per kilowatt-hour (kWh) for lithium-ion battery packs, which represents a 7% increase since 2021. Energy storage systems (ESS) for four-hour durations exceed \$300/kWh, marking the first price hike since 2017, largely driven by escalating raw.
