Solar Tracking Systems

Overview

What are the different types of solar tracking systems?

Solar Tracking Systems – DC motors are used in solar tracking systems to provide precise motion control. These motors can adjust the angle of the solar panel to maximise the amount of sunlight it receives. Wind Turbines – They are used in wind turbines for various applications, including yaw and pitch control.

What is a solar tracker?

Solar tracker orients payload towards Sun. Payload may be a solar panel or parabolic or dish collectors or Fresnel lenses or heliostat mirrors. For flat panel PV systems, tracker reduces the incidence angle between sun irradiation and PV array.

What is solar tracking & how does it work?

Typically used for ground-mounted solar arrays, solar tracking systems have become a mainstay in the increasingly competitive utility-scale and commercial/industrial segments of the global solar market. Generally speaking, a solar panel system with single-axis solar tracking installed will see a performance gain of 25% to 35%.
