Solar energy storage mobile power supply design

Overview

This research presents the architectural design and implementation of a solar photovoltaic-based uninterruptible power supply (Solar UPS) that synergistically integrates solar energy harvesting, energy storage, and real-time load management to ensure uninterrupted AC power delivery. How do mobile energy-storage systems improve power grid security?

In the high-renewable penetrated power grid, mobile energy-storage systems (MESSs) enhance power grids' security and economic operation by using their flexible spatiotemporal energy scheduling ability.

Why is mobile energy storage important?

Energy storage plays a crucial role in enhancing grid resilience by providing stability, backup power, load shifting capabilities, and voltage regulation. While stationary energy storage has been widely adopted, there is growing interest in vehicle-mounted mobile energy storage due to its mobility and flexibility.

How to design an optimal power supply system?

Therefore, to design an optimal power supply system, a combination of wind and solar energy should be considered. In addition, energy balance analysis indicates that the overall efficiency of the pumped storage was 52.5%. Sensitivity analysis shows that the key contribution to system cost was the load demand.

Can mobile energy storage support the power grid?

Several MESS demonstration projects around the world have validated its ability to support multiple aspects of the power grid. This subsection describes the scheduling of mobile energy storage in terms of theoretical approaches and demonstration applications, respectively.

What is a stationary energy storage system (ESS)?

The traditional stationary energy-storage system (ESS) is installed at fixed locations on the grid. It smooths out power fluctuations within a specific range due to line transmission capacity limitations or node voltage security constraints.

Is a standalone solar-wind-pumped storage system effective for an isolated microgrid?

This paper presents a techno-economic analysis of the standalone hybrid solar-wind-pumped storage system for an isolated microgrid. The effectiveness of the proposed system and optimization method was examined through comparison with undersized and oversized system.
