

SolarTech Power Solutions

The power of solar inverter

100KWH/215KWH

LIQUID/AIR COOLING

IP54/IP55

BATTERY 6000 CYCLES

Overview

Solar inverters use maximum power point tracking (MPPT) to get the maximum possible power from the PV array. They have a complex relationship between irradiance, temperature and total resistance that produces a non-linear output efficiency known as the I-V curve. It is the purpose of the MPPT system to sample the output of the cells and determine a resistance (load) to obtain maximum power for any given environmental conditions.

What is a solar power inverter?

A solar inverter converts the direct current (DC) electricity that solar panels produce into the alternating current (AC) electricity that our appliances run on. There are several types of solar power inverters and not all of them are made equal.

Are inverters the heart of a solar system?

If solar panels are the heart of your system, inverters are the brain. Your solar panels generate direct current (DC) electricity when sunlight hits them, but your home runs on alternating current (AC) electricity—the standard 120 or 240-volt power that flows through your outlets.

How does a solar inverter work?

Here's how it works: The inverter uses transistors that rapidly switch on and off, transforming the steady DC into alternating AC. This process happens thousands of times per second, creating the alternating electrical flow your home needs. Modern inverters do more than just convert power—they also enable solar power system monitoring.

How many times can solar panels be inverted?

Any electricity the solar panels produce will be inverted only once (from DC to AC) as it flows from batteries, through hybrid inverters, and to your home appliances or the electrical grid. There are three types of solar inverter options to choose from: string inverters, microinverters, and power optimizers.

What is a solar micro-inverter?

A solar micro-inverter, or simply microinverter, is a plug-and-play device used in photovoltaics that converts direct current (DC) generated by a single solar module to alternating current (AC). Microinverters contrast with conventional string and central solar inverters, in which a single inverter is connected to multiple solar panels.

Do solar systems come with a solar inverter?

Solar systems come with a solar inverter, PV panels, battery, and a rack to keep all the parts in place. Let's talk more about what is a solar inverter. A solar inverter is a precious component of the solar energy system.
