Cadmium telluride solar photovoltaics (PV) are a key clean energy technology that was developed in the United States, has a substantial and growing U.S. manufacturing base, and holds more than a 30% share of the U.S. utility-scale PV market. The Cadmium Telluride (CdTe) PV Perspective Paper (PDF).

Cadmium and tellurium form a stable semiconductor compound, CdTe, that is used in thin-film photovoltaic (PV) cells. CdTe PV cells are used in some of the world's largest photovoltaic solar facilities. They are the second most common PV technology in the world marketplace after crystalline silicon.

The Cadmium Telluride (CdTe) solar technology was first introduced in 1972 when Bonnet and Rabenhorst designed the CdS/CdTe heterojunction that allowed the manufacturing of CdTe solar cells. At first, CdTe panels achieved a 6% efficiency, but the efficiency has tripled to this day. Companies like.
