

SolarTech Power Solutions

Wind power generation and energy storage matching ratio

Overview

Numerical results demonstrate that the proposed method can fully utilize the stable output from the low-frequency correlation of wind and solar energy, combined with energy storage, to significantly reduce the fluctuation rate of regional grid-connected loads.

Numerical results demonstrate that the proposed method can fully utilize the stable output from the low-frequency correlation of wind and solar energy, combined with energy storage, to significantly reduce the fluctuation rate of regional grid-connected loads.

In response to the issue of limited new energy output leading to poor smoothing effects on grid-connected load fluctuations, this paper proposes a load-power smoothing method based on “one source with multiple loads”. The method comprehensively considers the proximity between the source and the

fluctuation standard for source-side and different load-side matching different loads, a self-adaptive algorithm based on Tent-chaotic mapping is employed to optimize the stable output from the low-frequency correlation of wind and solar energy, combining alleviating load Power smoothing's dual carbon goals, etc. The
